

Underwater Connector Anode Disks & Strips and Reference Electrodes

The CerAnode Underwater Connector (pictured below with a Strip Anode) makes installation easy and connection integrity foolproof. It features <100 micro-ohm electrical resistance and a high pressure environmental seal. Our Disk Anode, Strip Anode and special Reference Electrode feature these dielectric mounting studs eliminating any additional dielectrics or spacers. O-Ring and Compression seal technology is used to assure foolproof environmental isolation. The underwater connection allows for diver replacement if retrofitting is ever required.
